Scale AI Hiring Team

Dear Scale AI Hiring Team,

I am writing to apply for the VP, Research role. My work has centered on turning frontier AI research questions into operational systems: defining rigorous evaluation methods, building teams that can execute across research and product boundaries, and translating model behavior into decisions that leaders, customers, and external evaluators can trust.

I currently lead Responsible AI for Amazon's newly architected AGI division and previously led Nova Responsible AI. Across these roles, I have managed organizations as large as 50+ people and owned programs spanning model safety, red teaming, fairness, privacy, mitigation, and launch evaluation. I also led the Nova LMArena effort and founded the Nova Trusted AI Challenge, which drew 100+ applications and brought 10 university teams into structured frontier-model safety research. That combination of internal execution, external scientific credibility, and customer-facing translation is the center of gravity I would bring to Scale.

The Scale role is compelling because it sits where evaluation, data quality, post-training, and applied research meet real customer needs. My recent first-author work on CBRN uplift evaluation reflects the same operating model: make ambiguous frontier capabilities measurable, design methodology that can survive scrutiny, and produce evidence that changes how models are assessed and governed. Earlier work on BOLD, FLIRT, and large-scale NLU fairness similarly reflects a long-running focus on practical evaluation science for high-impact AI systems.

Scale is in a rare position to shape how leading AI labs, enterprises, and governments understand and improve frontier models. I would be excited to lead a research organization that advances that mission while building durable technical standards, strong scientific teams, and trusted partnerships with customers and the broader research community.

Sincerely,

Rahul Gupta
