Takeda Hiring Team

Dear Takeda Hiring Team,

I am writing to apply for the Head of Privacy, AI & Data Governance role. My work has focused on building practical governance for high-impact AI systems: translating emerging technical risks into policies, evaluation methods, operating mechanisms, and executive decisions that preserve trust while enabling responsible innovation.

I currently lead Responsible AI for Amazon's newly architected AGI division and previously led Nova Responsible AI. Across these roles, I have owned programs spanning privacy, fairness, safety, red teaming, evaluation science, and mitigation for advanced AI systems. I have also managed teams as large as 50+ and partnered across science, product, engineering, policy, legal-adjacent, academic, and executive stakeholders to make responsible AI usable inside large-scale product and technology organizations.

Takeda's role is compelling because it joins privacy, responsible AI, and trusted data governance in a highly regulated, patient-centered enterprise. My background is strongest where governance has to be technically credible and operationally practical: defining risk-based approaches, embedding responsible AI into product workflows, creating evidence that senior leaders can act on, and representing the work credibly to external evaluators and the research community. Recent first-author work on CBRN uplift evaluation, along with earlier work on BOLD, FLIRT, and fairness in large-scale NLU systems, reflects that same focus on rigorous measurement and safeguards for consequential AI systems.

I would be excited to help Takeda build scalable governance for privacy, AI, and personal-data stewardship across digital, R&D, commercial, cybersecurity, legal, HR, and business functions. The opportunity to strengthen patient, employee, regulator, and societal trust while enabling responsible technology adoption is closely aligned with the work I have been leading in frontier AI.

Sincerely,

Rahul Gupta
