UKG Hiring Team

Dear UKG Hiring Team,

I am writing to apply for the Sr Director Data Science role. My background is in leading applied science and machine learning organizations that turn ambiguous AI opportunities into measurable product, platform, and customer outcomes, with particular depth in generative AI, evaluation, responsible AI, and large-scale model development.

I currently lead Responsible AI for Amazon's newly architected AGI division and previously led Nova Responsible AI. Across these roles, I have managed organizations as large as 50+ people and owned programs spanning model evaluation, red teaming, fairness, privacy, safety, mitigation, and launch readiness. I also led the Nova LMArena effort, connecting evaluation diagnostics and post-training priorities to model iteration and externally visible model performance.

The UKG role is compelling because it combines AI strategy, production ML delivery, product partnership, responsible AI, and team scaling in an enterprise SaaS context where customer trust and measurable impact matter. My work has required the same operating model: identify high-value technical problems, define rigorous metrics, partner closely with product and engineering, build mechanisms for model quality and governance, and communicate tradeoffs clearly to senior leaders.

I would be excited to bring that experience to UKG's people-first AI strategy, helping build AI-powered products and platforms that are reliable, responsible, and useful for customers at enterprise scale.

Sincerely,

Rahul Gupta
